CST1510

CST1510 — Coursework 1 (CW1) specification

CW1 covers Weeks 1–7. It is a skills portfolio: each week you practise a small, self-contained version of the record-checking problem and keep the evidence of how your work developed.

The weekly README is the detailed brief for that week's tasks. This document defines the complete CW1 submission and the evidence that must be retained.

What you submit

Submit the following evidence for **each of Weeks 1–7**:

1. **Completed lab notebook** — including the warm-up fixes and all seven drills: `Week 0N .../LAB/W0N_Lab.ipynb`.
2. **Weekly mini-project** — the `.py` file produced from that week's `LAB/template.py`. Complete the highest tier you can demonstrate: Threshold, Typical, or Excellent.
3. **Handwritten journal page** — photographed and stored in the relevant `journal/weekNN/` folder.

Submit the following once, at the end of Week 7:

4. **Completed Cheat Sheet** — photographed, with Boxes 1–7 filled in.

CW1 mini-projects are intentionally short and disposable. You may change between the AI/Data Science, Cyber Security, and IT lanes from week to week. The lane becomes continuous only when CW2 starts in Week 8.

What the evidence should show

Your submission should make it possible to see that you can:

- complete the week's lab work and respond to errors;
- apply that week's Python concepts in a working mini-project;
- explain your decisions and learning in the journal; and
- record the week's key idea in the Cheat Sheet.

Keep your work in the module repository throughout the term. The weekly commit history may be used as supporting evidence of progress.

Assessment

Each week's mini-project and drills are organised into three achievement tiers. The relevant weekly README defines the exact standard:

Tier	Evidence pattern
Threshold	Warm-up completed, Drills 1–3, and the Threshold mini-project
Typical	Threshold evidence plus Drills 4–6 and the Typical mini-project
Excellent	Typical evidence plus Drill 7 and the Excellent mini-project

The final CW1 assessment will consider the submitted Weeks 1–7 portfolio and the quality and completeness of its supporting evidence. CW1 contributes **50% of the module mark**.

Proposed CW1 marking criteria

Criterion	Weight	What is assessed
Python knowledge and application	35%	Correct use of the concepts taught in Weeks 1–7, including values and types, decisions and loops, functions, data structures, files, classes, pandas, and string handling
Working mini-projects	25%	Functional weekly `.py` projects that meet the selected Threshold, Typical, or Excellent standard
Problem solving and debugging	15%	Ability to interpret errors, correct broken code, validate results, and make sensible technical decisions
Code quality and good practice	15%	Readable naming, clear structure, appropriate functions and classes, useful docstrings, and consistent formatting
Learning evidence and portfolio completion	10%	Completed lab notebooks, journal pages, Cheat Sheet Boxes 1–7, and an orderly record of progress
Total	**100%**	

The weekly Threshold, Typical, and Excellent labels describe the standard of work attempted. They do not replace the final percentage mark; the criteria above are used to judge the quality of the submitted portfolio.

Submission

> **Deadline** — the end of Week 7, at the submission time published by the module team.
>
> **Submission mechanism** — submit the GitHub repository link through Moodle.
